CENTRAL BANK OF BAHRAIN

## INTRODUCTION

Ripple is a company focused on advancing the world of payments. Multiple branches and solutions exist under the Ripple brand umbrella — RippleNet, the XRP Ledger, the XRP coin and RippleX. XRP is the native asset of the XRP ledger, a blockchain originally developed in 2011 by developers David Schwartz. While XRP and Ripple are intrinsically linked, it’s important to note that they operate as two distinct entities. Ripple is a fintech company that builds global payment solutions while XRP is an independent digital asset that can be used for microtransactions, remittance and online payments.

Ticker	XRP
Consensus mechanism	XRP Ledger Consensus Protocol
Network type	Open source, Decentralized & Permissioned blockchain
Maximum Supply of Tokens	One Hundred Billion
Platform Function	Decentralized Application platform powered by smart contracts
Token Function	Cross-border settlement
Use cases	Payment

## RIPPLE, XRP LEDGER AND RIPPLE X

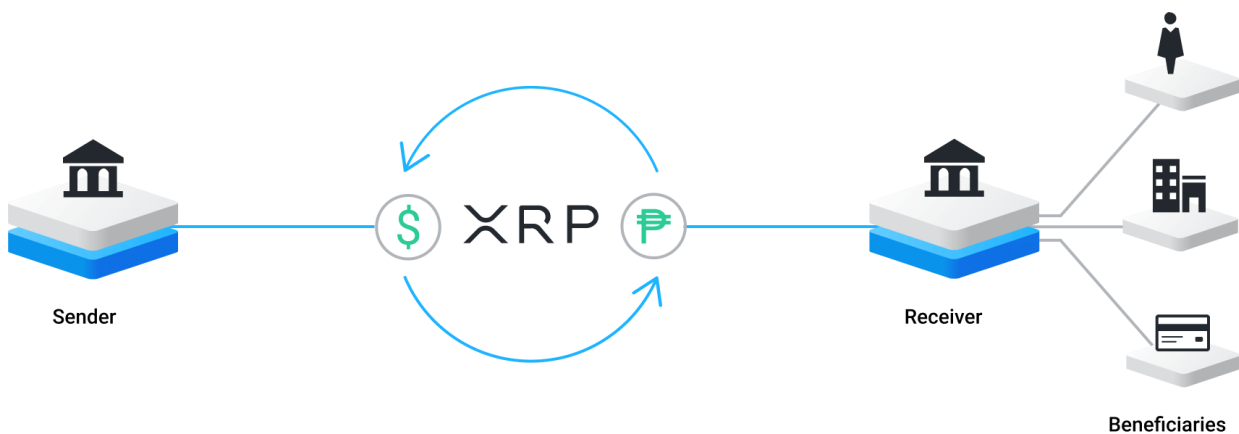

RippleNet is a global network that financial institutions can use to transfer money more quickly, with greater transparency and at less cost through a unified system. RippleNet requires the use of just one application programming interface (API). Ripple formerly also had products called xRapid, xCurrent and xVia, although the company combined those solutions to form RippleNet in 2019.

The XRP Ledger is an open-source blockchain on which the XRP coin runs. XRP is the native asset of the XRP Ledger. The XRP Ledger and the XRP coin run independently of the company Ripple, although Ripple uses both for various solutions. Also abbreviated to XRPL, the XRP Ledger serves as a blockchain on which parties can construct solutions, similar to the Ethereum blockchain.

RippleX serves as a platform touting blockchain-based solutions that interested parties can use for their various value-transfer-based use cases. The platform looks to serve as an easier method for harnessing blockchain-based solutions, as opposed to interested parties building their own solutions from scratch. RippleX utilizes the XRP Ledger and aims for simplicity in terms of mainstream compatibility. There are two other protocols that exist under RippleX - Interledger helps with payments compatibility when multiple different systems are involved and PayString works to simplify payment addresses.

## XRP TOKEN AND UTILITY

Ripple developed the XRP ledger to facilitate cross-border payments between banks around the world. The ledger is a permissionless network of peer-to-peer servers that powers XRP operations. XRP is the native token and is intended to act as a “bridge” between hard-to-match fiat currencies. So if, for example, there are no market makers on the network willing to trade shekels for shillings, one can sell the former for XRP and then use it to buy the latter. XRP can be sent directly without needing a central intermediary, making it a convenient instrument in bridging two different currencies quickly and efficiently. RippleNet customers can use XRP to bridge two currencies in as little as three seconds, ensuring payments are quickly sent and received in local currency on either side of a transaction.

XRP is also used to provide on-demand liquidity (ODL) for Ripple’s flagship RippleNet service – a global payments network of financial institutions that was originally three separate products prior to 2019: xCurrent ( a real-time settlement solution), xRapid (a liquidity solution) and xVia (a payment API.)

Other use cases of the XRP:

- Forex
- Escrow
- Real-time Gross Settlement
- Payment for digital goods and other near-instantly products and services.
- P2P purchases
- Central Bank IOU
- Decentralized Exchange
- Online Voting

## **XRP LEDGER**

The ledger is maintained by independent participants of a global “XRP Community,” of which Ripple is an active member. Independent validator nodes come to an agreement on the order and validity of XRP transactions. This agreement, called consensus, serves as final and irreversible settlement. The ledger reaches consensus on all outstanding transactions every 3-5 seconds, at which point a new ledger is issued. Anyone can be a validator, and active validators on the ledger today include universities, exchanges and financial institutions. There are currently 36 validators, and Ripple runs 6 of them—16%.

Operating as a validator is an option for any entity. While PoW blockchains produce blocks — compartmentalized segments of the overall chain that each include certain information — the XRPL produces “ledgers.” Every ledger holds information such as data tying it to the former ledger in the chain, account totals and more. Transactions and network alterations must achieve agreement from a certain number of validators.

It takes between three to five seconds for the XRP Ledger to confirm each block (ledger) — completing transactions. A small amount of XRP – about 10 drops (a unit of XRP) worth 0.00001 XRP – is destroyed to cover transaction fees. The transaction cost is designed to increase along with the load of the network to disincentivize using the network during busy periods. All XRP transactions are executed and settled on the ledger.

## **TOKEN ISSUANCE**

The original founders pre-mined (created before the project’s launch) one hundred billion XRP tokens in 2012. Ripple retained 80 billion tokens to fund future operations and development, whilst the founders divided the remaining XRP between them. Unlike bitcoin and other mined cryptocurrencies, where new coins enter the market in the form of block rewards, XRP enters circulation whenever Ripple decides to sell coins from its pre-mined stash on the secondary market

## **CONSENSUS MECHANISM**

The XRP ledger uses the Ripple Consensus Algorithm, which differs from proof-of-work and proof-of-stake mechanisms in that network participants are known and trusted by other participants. Unlike miners, they are not rewarded for securing the network. Once validators agree, a new block – a “ledger version” – is created and validated. The block’s content cannot be changed. This allows servers in the network to store a complete history of the ledger state.

## SHARIAH OPINION

---

The XRP Ledger is an open-source blockchain on which the XRP coin runs. XRP is the native asset of the XRP Ledger. Ripple developed the XRP ledger to facilitate cross-border payments between banks around the world. The ledger is a permissionless network of peer-to-peer servers that powers XRP operations. XRP is the native token and is intended to act as a “bridge” between hard-to-match fiat currencies. As such, the XRP token has a Shariah compliant utility and can be deemed Shariah compliant.

## ABOUT SRB

Since our humble beginnings 17 years ago in the Kingdom of Saudi Arabia we've grown to include +100 companies across a host of industries, 5,000 transactional programs, 5 interdisciplinary teams and a combined scholarly workforce of 31 Sharia Scholars from 16 countries. And we're not done yet: our Sharia Audit and Sharia Advisory services will continue to improve—serving local and international businesses to help them maintain and manage Shari'a compliance.

Our combination of international and local market knowledge and multi-disciplinary perspective of Sharia give us an edge in the professional Sharia Advisory and Sharia Audit services industry in the GCC. The scope and value of our services, and the help they offer in building a thriving economy, keeps us excited.

The future of Sharia Advisory and Audit is exciting and we are very lucky to be a part of this business!
